

Fitpage Product Assignment

Assume that you are building a Fitness tracking App which collects certain parameters about an individual either via their Mobile phone (google fit/apple heath) or via Fitness tracking devices (garmin, iwatch etc.) or via apps like Strava.

As a Sr Product Manager your job is to create a simple PRD which will include features to

- Collect these parameters from various sources (clearly call out the assumptions made here, the parameters you will choose to collect)
- Build a feature which will make sense of the data collected and create actionable insights for the End user.

You are free to explore the existing apps and clearly call out if you have taken inspiration from any of the existing apps.

What We're Evaluating

The goal of this assignment is to **assess your problem identification skills and product solutioning approach**. You don't need to provide a fully detailed solution but should cover the following key aspects:

1. **Basic PRD** (Product Requirements Document)
2. **Success Metrics** – How will you measure its impact?
3. **Go-To-Market Strategy** – How will you roll it out to users?
4. **Key Data Points** – What will you track to gauge success?
5. **Failure Analysis** – How will you determine if the feature isn't performing well?

Important Notes:

- Justify **why** you chose this feature.
- Keep the focus on **problem-solving and user impact** rather than just technical execution.
- **DO NOT USE chatGPT.**
